

CloudSync API — Technical Reference v3.2

Rate Limits

The CloudSync API enforces a rate limit of 100 requests per minute per API key on the Standard tier, and 1,000 requests per minute on the Enterprise tier. Requests exceeding the limit receive an HTTP 429 response with a Retry-After header indicating the number of seconds to wait before retrying.

Authentication

All requests must include an Authorization header with a Bearer token. Tokens expire after 24 hours and must be refreshed using the /auth/refresh endpoint, which accepts a valid refresh token and returns a new access token along with a 30-day refresh token.

File Size Limits

The maximum file size for a single upload via the /files/upload endpoint is 5 GB on the Standard tier and 50 GB on the Enterprise tier. Files larger than 100 MB are automatically split into chunks of 25 MB during upload using the multipart upload protocol described in Section 4.2.

Webhooks

CloudSync can send webhook notifications for file.created, file.updated, and file.deleted events. Webhook endpoints must respond with an HTTP 200 status within 5 seconds; failed deliveries are retried up to 3 times with exponential backoff starting at 10 seconds.

Deprecation Notice

The v2 API will be fully deprecated on March 1, 2027. All integrations should migrate to v3 before this date. The primary breaking change in v3 is the removal of the /files/list endpoint in favor of the paginated /files/search endpoint.
